# World Agricultural Production

## Foreign Cotton Area and Production for 2003/04 Expected to Rise Following Higher World Cotton Prices

While global financial conditions, government policies, and weather each influence foreign cotton area, for cotton exporting nations world cotton prices and prices of competing crops play a crucial role in determining the area planted to cotton. Farmers often use the Cotlook A-Index as an indication of profitability from cotton production. The A-index is an average of the five lowest-priced 16 comparable world cotton varieties offered for sale by cotton exporting

countries. Generally, a direct relationship exists between cotton area and the price index for the previous year. The price line on the graph shows an average annual marketing year price beginning in 1995/96, and includes an average price from August-January for 2002/03. During the first six months of the current marketing year, the price index averaged nearly 11 cents above the same period a year earlier, indicating that foreign cotton area in 2003/04 will be above last year. Area shifts also depend upon competing

crop prices, currency relationships, and government policies encouraging or restricting planted area and availability of inputs. Accounting for these factors, preliminary indications suggest that foreign cotton area and production will be roughly 27.5 million hectares and range from 77.0 to 78.0 million bales in 2003/04, compared with 25.8 million and 70.5 million for 2002/03.

To derive this projection, USDA reviewed producer prospects in countries accounting for above 70 percent of foreign area in 2002/03.

The estimates in this report and the following table reflect official USDA estimates as of February 2003. For more detail on country forecasts see Agricultural Attachés Cotton Reports for 2003/04 (<http://www.fas.usda.gov/scripts/attacherep/default.asp>). The table below presents the 2003/04 forecast with the most recent five-year average and an 11-year history of foreign area, yield, and production.

<b>Foreign Cotton Area, Yield, and Production</b>			
<b>Years</b>	<b>Harvested Area (1,000 Ha.)</b>	<b>Yield (Kg./Ha.)</b>	<b>* Production (1,000 Bales)</b>

### **Brazil: 2002/03 Soybean Crop Yields Forecast At Record Levels**

Brazil's 2002/03 soybean crop is currently estimated at a record 51.0 million tons, up 2.0 million from last month and up 7.5 million or 17 percent from last year's harvest. The rainfall pattern during the soybean crop's vegetative and reproductive growth periods (Nov-Jan) has been almost ideal in primary growing regions. Harvested area is estimated at 18.0 million hectares, unchanged from last month but up 10 percent from last year's record level.

Soil moisture levels have been adequate to excellent for the entire post-planting season throughout Brazil, enabling the crop to grow without significant periods of stress.

As Brazil enters the main harvest period of mid-February to April, the soybean crop has the potential to achieve record yields in many states. This includes the states of Rio Grande do Sul, Santa Catarina, Parana, Sao Paulo, Mato Grosso do Sul, Mato Grosso, Goias, Bahia, and Minas Gerais which represent 97 percent of total production. USDA currently forecasts 2002/03 national soybean yields at a record 2.83 tons per hectare, up roughly 6.5 percent from last year's drought-affected yield. The benign weather pattern has been especially supportive of crop development this year and is ensuring bumper crop prospects. Soil moisture reserves are adequate in nearly all regions to carry the bulk of the crop to maturity. Excessive rains during February could impede harvest progress and downgrade quality, but rainfall would have to reach extreme levels to negatively affect the current crop's yield potential.

### **China: Weak Economic Returns Lead to Lower Wheat Production**

Wheat production for 2002/03 is estimated at 91.0 million tons, down 1.0 million or 1 percent from last month and down 3 percent from last year. Wheat area for 2002/03 is estimated at 23.5 million hectares, down 5 percent from last year and the lowest area on record. Wheat area has dropped by more than 20 percent since 1997/98. Area has been declining in response to poor returns for wheat, declining government support for low-quality wheat, and increasing support for alternative crops. The estimated yield of 3.87 tons per hectare is slightly higher than last year and close to the 5-year average. Dry weather on the North China Plain in spring 2002 had a minor affect on winter wheat yields, and the weather for spring wheat was generally favorable.

### **Russia: Wheat Crop Highest in Over 20 Years**

Russian wheat production for 2002/03 is estimated at 50.6 million tons, up 1.1 million or 2 percent from last month and up 3.7 million or 8 percent from last year. Estimated area is unchanged at 25.7 million hectares. The revised production estimate is based on preliminary harvest data from the Russian State Statistical Committee (Goskomstat). Output reached the highest level since 1978/79, when an estimated 61.5 million tons of wheat were harvested from 34.5 million hectares. Timely June rains in the Volga Valley reversed persistent dryness that had threatened grain yield potential, and spring wheat output in Siberia benefited from relatively dry weather during the harvest campaign.

### **Argentina: Corn Production Increases due to Higher Area and Yield**

Argentina's 2002/03 corn production is estimated at 14.5 million tons, up 1.0 million from last month, or 7 percent, and up 1 percent from last season's output of 14.4 million tons. Harvested area is forecast at 2.45 million hectares, up 100,000 hectares from last month and unchanged from last season. Yield is forecast at 5.92 tons per hectare, the second highest yield on record.

Near record yields are expected for central Argentina while below normal yields are forecast for southern areas. Current satellite imagery indicates above-normal rainfall occurred during

vegetative and flowering stages of corn (November to December), improving yield potential in the key corn-growing areas of central Argentina. However, high temperatures and below normal rainfall in January hurt late developing corn in southern Buenos Aires and La Pampa Provinces (9 percent of production).

Favorable expected returns encouraged farmers to plant more corn this season than previously forecast, and corn area matched last year's levels. Reports indicate BT corn varieties increased to 40 percent of total corn area, up from 36 percent last year, boosting yields and lowering pesticide use. Corn harvesting typically begins at the end of February, and by early May is 50 percent complete.

### **Argentina: Wheat Production Declines due to Heavy Rains**

Argentina's 2002/03 wheat production is estimated at 12.5 million tons, down 0.5 million or 4 percent from last month and 20 percent lower than last year's output of 15.5 million. Wheat area is estimated at 5.9 million hectares, unchanged from last month and down 13 percent from last year's area of 6.8 million. Yield is forecast at 2.12 tons per hectare, below the 10-year average.

Harvest results indicate poor yields in central Argentina and key areas of southern Buenos Aires Province. Heavy rains in November flooded some fields. Producers with fields untreated with fungicides, suffered losses while wetness caused more disease pressure. Fewer inputs were used this year due to financial difficulties. Wheat planting occurred in May and June during the height of the economic uncertainty facing Argentina due to the devaluation, banking freeze, and increased export taxes.

### **China: Cotton Yields Higher than Expected**

Cotton production for 2002/03 is estimated at 22.0 million bales (4.79 million tons), up 0.5 million or 2 percent from last month, but down 10 percent from last year's bumper crop of 24.4 million bales. The planted area estimate was unchanged this month at 4.2 million hectares, down 13 percent from 2001/02. Preliminary harvest results from several major cotton provinces indicate better-than-expected crops on the North China Plain (NCP) and record yield and production in Xinjiang. The estimated yield of 1,140 kilograms per hectare is 3 percent above last year's record yield. The reasons for the high yield in 2002/03 include the expanded planting of Bt varieties on the NCP, effective management practices, and favorably dry harvest weather in most areas. Cotton was a profitable crop for Chinese farmers in 2002, which may promote increased plantings in 2003.

### **Thailand: Rice Production is Forecast Lower in 2002/03**

Rice production for 2002/03 is forecast at 17.2 million tons (26.06 million, rough basis) down 0.3 million or 2 percent from last year's revised estimate of 17.5 million tons (26.5 million, rough basis).

Planted area for 2002/03 dropped by 1 percent to an estimated 10.0 million hectares, and the forecast yield of 2.61 ton per hectare is down slightly from a year ago.

The Northeastern region grows half the crop in the main production season and was affected by severe drought as the season began and by excessive rain before harvest. As a result, the main paddy crop is forecast to drop by 4 percent, to 13.2 million tons. In contrast, the second paddy crop is expected to increase by 6 percent, to 4.0 million tons. Water supplies are sufficient in the major reservoirs for irrigation, and attractive prices led to an expansion of second crop planted area.

#### **South Africa: Forecast Corn Production Unchanged as Eastern Dryness Balanced by Good Western Weather**

South Africa's 2002/03 corn production is estimated at 8.0 million tons, unchanged from last month, but down 1.1 million or 12 percent from last year's crop. Harvested area is estimated at 3.3 million hectares, unchanged from last month, but down 50,000 hectares from last year. The estimated yield of 2.42 tons per hectare is approximately equal to the 5-year average, and estimated planted area of 3.3 million hectares is slightly below the 5-year average. Crop conditions have been nearly average in the western region of the Maize Triangle where the rains arrived on time in mid-December and rains were near-to-above average during January. In the Maize Triangle, fair conditions in the west probably offset potential yield losses in eastern regions where below normal rainfall was reported during January.

This report uses information from the Foreign Agricultural Service's global network of agricultural attaches and counselors, official statistics of foreign governments and other foreign source materials; and the results of economic and satellite imagery analysis. Estimates of foreign area, yield, and production are from the Production Estimates and Crop Assessment Division, FAS, and are reviewed by USDA's Inter-Agency Commodity Estimates Committees. Estimates of U.S. area, yield, and production are from USDA's National Agricultural Statistics Service. Numbers within the report may not add to totals because of rounding. This report reflects official USDA estimates released in the World Agricultural Supply and Demand Estimates (WASDE-395), February 11, 2003.

The Production Estimates and Crop Assessment Division, FAS, prepared this report. The next issue of World Agricultural Production will be released after 9:00 a.m. Eastern Time on March 11, 2003.

**TABLE 18**

The table below presents a 21-year record of the differences between the February projection and the final estimate. Using world wheat production as an example, changes between the February projection and the final estimate have averaged 2.3 million tons (0.4 percent) and ranged from -7.3 to 6.8 million tons. The February projection has been below the final 16 times and above the final 5 times.

**RELIABILITY OF PRODUCTION PROJECTIONS**

1/ The final estimate for 1981/82-2000/01 is defined as the first November estimate following the marketing year.

2/ May not total 21 if projection was the same as the final.

3/ Includes corn, sorghum, barley, oats, rye, millet, and mixed grain.
